# The LLVM compiler framework

Writing a pass: Quick Start

Daniele Cattaneo

Politecnico di Milano

2020-05-03

### **Contents**

#### Introduction

**LLVM framework quick start** 

# **Understanding LLVM**

LLVM is **not** a compiler.

# **Understanding LLVM**

LLVM is **not** a compiler.

LLVM is a collection of components which is useful to build a compiler.

# **Getting LLVM**

- ▶ "old" git mirrors
  - only llvm repo (subprojects in separated repos, can be added later)
  - ► git clone -b release\_90 --single-branch git@github.com:llvm-mirror/llvm.git

- ► "new" git monorepo
  - ► all in one repo (llvm + major subprojects)
  - ▶ git clone -b release/9.x --single-branch git@github.com:llvm/llvm-project.git

#### What LLVM is made of

- ► C++ libraries
  - ► src/include/llvm/...
  - ▶ src/lib/...

- ▶ small application (tools)
  - ▶ src/tools/...
  - ▶ src/utils/...

You can find binaries of them in the installation directory under root/bin/...

## clang

- clang is a compiler based on LLVM
- ► It compiles all major C-like languages
- It is part of the git monorepo
- It can be added as a tool in the LLVM framework but must be manually cloned in the tool directory
  - cd src/tools
  - 2. git clone http://llvm.org/git/clang(git mirror version)
- You can easily see on a production quality compiler the impact of changes you made on your local copy of LLVM

#### **Commands**

**IIvm-as** LLVM assembler

Ilvm-dis LLVM disassembler

**opt** LLVM optimizer

**IIc** LLVM static compiler

III directly execute programs from LLVM bitcode

**Ilvm-link** LLVM bitcode linker

**Ilvm-mca** LLVM machine code analyzer

**Ilvm-nm** list LLVM bitcode and object file's symbol table

**Ilvm-stress** generate random .ll files

**Ilvm-config** prints out install configuration parameters

Ilvm-dwarfdump print contents of DWARF sections

For a complete reference, see the LLVM command guide\*

### **Contents**

Introduction

LLVM framework quick start

# Simulating a LLVM driver manually

```
.c source
clang -emit-llvm
     __.bc / .11
          l llvm-link
               L.bc / .11
                        __.bc / .11
1.11 \rightarrow 11 \text{vm-as} \rightarrow .bc
.bc \rightarrow llvm-dis\rightarrow .11 <sub>|</sub>
```

# Writing a LLVM pass

There are a lot of tutorials available:

► Official developer guide llvm.org/docs/WritingAnLLVMPass

Out-of-source pass github.com/quarkslab/ llvm-dev-meeting-tutorial-2015

We will follow the first one, with a few adjustments.

# **Building LLVM**

To test your pass you need a **Debug+Assertions** build of LLVM.

This build needs to be **kept separated** from normal Release builds (it's very slow!)

The best way to get such a LLVM build is to make it yourself!

# **Building LLVM**

▶ Detailed instructions: https://llvm.org/docs/GettingStarted.html

Problem 1 With the default options, a finished build takes 25 GB of disk space

Problem 2 A standard build with the GNU toolchain uses a lot of RAM (≈16 GB or more with a modern 4 core CPU!) especially when linking

We need to customize the build process a bit...

# **Building LLVM**

- ► The build flags I like to use:
  - -GNinja
  - -DLLVM\_ENABLE\_PROJECTS='clang'
  - -DLLVM\_INSTALL\_UTILS=ON
  - -DLLVM\_BUILD\_LLVM\_DYLIB=ON
  - -DLLVM\_LINK\_LLVM\_DYLIB=ON
  - -DLLVM\_OPTIMIZED\_TABLEGEN=ON
  - -DLLVM INCLUDE EXAMPLES=OFF
  - -DCMAKE\_INSTALL\_PREFIX=/opt/llvm-9.0-d
  - -DLLVM\_USE\_LINKER=11d
  - -DCMAKE\_C\_COMPILER=clang-9
  - -DCMAKE\_CXX\_COMPILER=clang++-9
- ▶ Building with LLVM itself solves the RAM usage problem!
- ► Using **shared libraries** drops the disk usage to **10 GB**. The build products alone will still take 20 GB of disk space...

# **Testing**

LLVM has an internal testing infrastructure\*. Please use it.

**Ilvm-lit** LLVM Integrated Tester

- 1. Forge a proper LLVM-IR input file (.ll) for your test case
- 2. Instrument it with lit script comments
- 3. Run lit on your test
  - Ilvm-lit /llvm/test/myTests/singleTest.ll run a single test
  - ► llvm-lit /llvm/test/myTests run the test suite (folder)
- **4.** Run lit on the LLVM test suite (regression testing)

To submit a bug report to LLVM developers you will be asked to write a lit test case that highlights the bug.
